Website Build & Deploy Guide

This guide covers how to build, preview, and deploy the companion website locally and to GitHub Pages.

Quick Start

View the Website Locally

```
# From project root
python -m http.server 8000

# Then open in browser:
# http://localhost:8000/website/src/index.html
```

That's it! The website is pure HTML/CSS/JavaScript. No build process needed.

Project Structure

```
website/
  src/                                # Static website files
    index.html                       # Landing page
    resources.html                   # Resources directory
    materials.html                   # Materials directory
    css/
      style.css                      # Main stylesheet
    images/                          # Presentation images

  content/                           # Source markdown files (for reference)
    resources/                       # Pre-reading materials
    materials/                       # Presentation, handouts
    assessment/
      ai-literacy-diagnostic.html

  README.md                          # Development documentation

docs/                                # OUTPUT (GitHub Pages)
  index.html                         # (generated)
  resources.html
  materials.html
  css/style.css
  assessment/
    ai-literacy-diagnostic.html
  images/
```

Local Development

Prerequisites

- Python 3 or Node.js (for local server)
- Text editor (VSCode recommended)
- Modern web browser

Running Locally

Method 1: Python (Easiest)

```
cd website/src
python -m http.server 8000

# Open: http://localhost:8000
```

Method 2: Node.js

```
cd website/src
npx http-server

# Open: http://localhost:8080
```

Method 3: VSCode Live Server Extension 1. Install “Live Server” extension 2. Right-click `website/src/index.html` 3. Select “Open with Live Server”

Making Changes

Editing HTML: - Edit `.html` files directly in `website/src/` - Changes appear immediately when you refresh browser

Editing CSS: - Edit `website/src/css/style.css` - Refresh browser to see changes

Adding New Pages: 1. Create new `.html` file in `website/src/` 2. Copy structure from `index.html` 3. Update navigation links in header 4. Add link to page in other pages’ navigation

Testing Navigation

Test these paths: - `/index.html` - Landing page - `/resources.html` - Resources list - `/materials.html` - Materials list - `/assessment/ai-literacy-diagnostic.html` - Quiz - `/css/style.css` - Stylesheet - `/images/` - Presentation images

Building for Deployment

The website is already “built” - it’s just static files. But if you modify source markdown files in `website/content/`, you’d need to render them to HTML.

If Using Quarto for Content Rendering

```
# From website/ directory
quarto render

# This converts markdown → HTML and outputs to ../docs/
```

Then deploy the docs/ folder to GitHub Pages.

Without Quarto

Just copy files directly:

```
# Copy everything from src/ to docs/
cp -r website/src/* docs/

# Then deploy docs/ to GitHub Pages
```

Deployment to GitHub Pages

Automatic Deployment (Recommended)

Your repo is already configured for GitHub Pages from docs/ folder.

To deploy:

1. Copy website files to docs/ folder:

```
cp -r website/src/* docs/
```

2. Commit and push:

```
git add docs/
git commit -m "Deploy website"
git push origin main
```

3. GitHub automatically publishes from docs/ folder to:

- <https://michaelborck-presentations.github.io/ai-in-pedagogical-design-and-delivery/>

Checking Deployment Status

- Go to repo → Settings → Pages
 - You'll see the live URL and deployment status
 - If “Source” shows docs/ and main branch, you're good to go
-

Website Features

Responsive Design

- Mobile-friendly (tested on phones, tablets, laptops)
- CSS Grid and Flexbox for layout
- Media queries for smaller screens

Accessibility

- Semantic HTML5
- Proper heading hierarchy
- Color contrast meets WCAG standards
- Mobile-accessible navigation

Performance

- No external dependencies
- Minimal CSS (~10KB)
- Images embedded directly
- Fast loading (< 1s on typical connection)

Features

- Sticky navigation
- Gradient hero section
- Card-based layout
- CTA buttons
- Resource cards with metadata
- Footer with links
- Breadcrumb navigation

Customization

Change Colors

Edit CSS variables in `website/src/css/style.css`:

```
:root {  
  --primary: #667eea;           /* Main color */  
  --primary-dark: #764ba2;      /* Darker shade */  
  --accent: #f59e0b;           /* Accent color */  
  --text-dark: #1f2937;        /* Text color */  
  --text-light: #6b7280;       /* Secondary text */  
  --bg-light: #f9fafb;         /* Light background */  
}
```

Then save and refresh browser.

Change Content

Edit HTML files directly: - `website/src/index.html` - Main landing page - `website/src/resources.html`
- Resources list - `website/src/materials.html` - Materials list

Add New Section

1. Create `website/src/new-page.html`
2. Copy HTML structure from `index.html`
3. Modify content in `<section>` tags
4. Add navigation link in `<nav>` section
5. Save and test locally

Embed Videos or Other Media

Add to HTML:

```
<iframe width="560" height="315"  
  src="https://www.youtube.com/embed/VIDEO_ID"  
  frameborder="0" allowfullscreen></iframe>
```

Troubleshooting

Pages not loading

- Check file paths in links (relative to `website/src/`)
- Ensure files are in correct folder
- Check browser console for errors (F12)

Styles not applying

- Clear browser cache (Ctrl+F5 or Cmd+Shift+R)
- Check CSS file is in `website/src/css/style.css`
- Verify `<link>` tag points to correct path

Images not showing

- Images should be in `website/src/images/`
- Use relative paths: `../images/filename.png`
- Check image file extensions (.png, .jpg, etc.)

Links broken

- Use relative paths for internal links
 - Root should be `website/src/`
 - Example: `resources.html` or `assessment/ai-literacy-diagnostic.html`
-

SEO & Metadata

Each page has: - Unique `<title>` tag (appears in browser tab) - `<meta description>` (appears in search results) - Proper heading hierarchy (h1, h2, h3) - Semantic HTML (nav, section, footer, etc.)

To improve SEO: 1. Update title and description for new pages 2. Use descriptive anchor text for links 3. Add alt text to images (if any) 4. Keep heading hierarchy logical

File Size & Optimization

Current website: - CSS: ~10 KB - HTML (all pages): ~50 KB - Total: ~60 KB (very lightweight)

No optimization needed, but if you want to reduce further: - Minify CSS: `css-minify` tool or online minifier - Remove unused CSS: Rarely needed here

Backup & Version Control

All website files are in git:

```
git log --oneline website/src/ # See all website changes
git diff website/src/         # See what changed
git restore website/src/      # Undo changes
```

To revert to previous version:

```
git checkout COMMIT_HASH website/src/
git commit -m "Revert website to previous version"
```

Next Steps

1. **Test locally** - Make sure it looks good
2. **Customize** - Update colors, text, links as needed
3. **Deploy** - Copy to `docs/` and push to GitHub
4. **Share** - Send the GitHub Pages URL to participants

Your live website will be at:

<https://michaelborck-presentations.github.io/ai-in-pedagogical-design-and-delivery/>

Questions?

- GitHub issues: Report bugs or suggest improvements
- Email: michael.borck@curtin.edu.au
- Edit files directly - it's just HTML/CSS!
