

Instructor Notes – Overall Workshop Flow & Framing

Overall Stance

- Core message: “Neither ban nor blindly embrace – design work and assessment so human skills stay irreplaceable.”
 - Explicit tie to **Assessment 2030**:
 - “We’re in **Lane 2** today: using AI and prompts in ways that make student thinking more visible, not less.”
 - Frame AI as **infrastructure**, prompts as **literacy**:
 - “Tools will change, but the language they speak – prompts – is what you’re really learning.”
-

Use the Quiz Findings Deliberately

Early in the opening (after your Bloom / AI-tutor hook), bring in the pre-workshop quiz results for ~5 minutes to set tone and pace:

- “You’re generally **positive and curious** about AI” → permission to experiment, not to “sell” AI.
- “You’re **confident trying new tech**” → but many are beginners with LLMs, so go slowly and scaffold.

- “Your main worries are **reliability** and **student misuse**” → promise up front:
 - You’ll show how to **critique AI output** (Activity 3).
 - You’ll explore how to **stress-test and redesign assessment** (Activity 4).
 - You’ll talk specifically about **safe/approved tools** and data (Activity 5).

This makes the workshop feel **tailored**, not generic.

Keep the Existing Structure

Your slides already give a solid arc:

- Welcome & ITS / Architect / Practitioner / Challenges / Evolving Role.
- Activities 1–5 anchored on:
 - **Automate** → **Prompts** → **Critique** → **Assessment** → **Safety/Next Steps**.

Given **beginners + 2 hours + “go slow”**, aim for **less content, more guided practice**. Avoid adding lots of new conceptual slides.

If you add one new slide, consider a very simple “**AI tools**” slide:

- Show 3–4 logos only (e.g., Copilot, ChatGPT, Claude).
- One line:
 - “There are hundreds of tools. They mostly differ in interface and integrations – underneath, they respond to prompts.”
- Emphasise Copilot as the **approved** one, and reassure:
 - “Prompts you develop here will transfer to whatever tool you have.”

Avoid an overwhelming “zoo of tools” slide.

Suggested 2-Hour Flow (Approximate)

You can adjust timings on the day.

0–10 min – Welcome, Hook, Quiz & Assessment 2030 Bridge

- Start with the **Bloom 2-sigma / AI tutor** hook (from your Welcome slide notes), connecting one-to-one tutoring → AI tutors/assistants → “what does this mean for us at Curtin?”.
- Then show one slide with the **three quiz insights** to ground things in your participants’ attitudes and concerns.
- Connect explicitly to **Assessment 2030**:
 - “You just heard a lot about assessment this morning; now we’ll get **hands-on** with how AI and prompts affect your **design and delivery** in that landscape.”

10–25 min – Context Slides

- Welcome, ITS, Architect, Practitioner, Challenges, Evolving Role.
- Keep this **high-level and brisk**; use your notes as talking points, not mini-lectures.
- Make your balanced stance explicit:
 - “AI raises real risks – equity, bias, integrity – but we manage those by **better design and critical use**, not by banning tools.”

25–40 min – Tiny Copilot Demo + Framing for Activities

- Choose **one simple, low-risk demo** that doesn’t rely on file downloads, e.g.:
 - “Rewrite these assessment instructions for **clarity and inclusivity**.”
 - “Brainstorm 5 low-stakes formative tasks for **[concept]**.”
- Show:
 - Naive prompt → output.
 - Slightly improved prompt (with context, audience, tone) → better output.

This sets up **Activity 1 (summarise & twist)** and **Activity 2 (prompt design)** without overcomplicating tools.

40–60 min – Activity 1: Automate the Tedious

- In pairs, choose a **tedious teaching/design task**, e.g.:
 - Draft weekly announcements.
 - Generate initial MCQs.
 - Rewrite rubric descriptors.
- Ask them to:
 - Write a **first prompt** individually.
 - Run it (if they have a device) or you run exemplar prompts on screen.
 - Share: “What did AI do well? What did it miss?”

Message:

“Offload drudgery, but you remain the **professional editor**.”

60–80 min – Activity 2: The Art of the Prompt

- Introduce one simple, reusable **prompt pattern** (drawing from `craft-prompting-framework.qmd` / `seven-techniques.qmd`):
 - Context: who/what/level.
 - Task: what you want AI to do.
 - Format: bullets, table, rubric, etc.
 - Constraints: length, tone, curriculum alignment.
- Have them iterate:
 - Start from their **Activity 1 prompt**.
 - Apply the pattern/framework.
 - Compare outputs.

Emphasise:

“You don’t need to know about system vs user messages – just be **explicit, structured, and iterative.**”

80–95 min – Activity 3: 5-Step Critique Framework

- Directly addresses “**AI reliability**” concerns from the quiz.
- Give them the simple checklist (Purpose, Plausibility, Evidence, Stakes, Action).
- Have them critique one of the outputs from Activities 1–2.

Connect back to learning design:

“This is the kind of critique we want **students** to use as well.”

95–115 min – Activity 4: Assessment Stress-Test

- Bridge to **Assessment 2030 (Lane 1 vs Lane 2)**:
 - “Let’s see how an AI handles one of our existing assessment tasks.”
- In small groups:
 - Pick a real assessment (or a stylised version).
 - Ask AI:
 - > “You are a high-achieving student in [course]. Complete this task.”
 - Discuss:
 - * How easily does AI succeed?
 - * What parts of the task are most “automatable”?
 - * How could we tweak this to reveal **student judgement/process** rather than just the final product?

This honours the morning session and makes your workshop feel like **follow-through**, not a separate track.

115–120 min – Activity 5: Secure, Safe, Sustainable AI + Wrap-Up

- Keep it **short**:
 - Clarify what’s **approved** (Copilot) and basic data/privacy rules.
 - Reiterate: “Use organisational tools where possible; never paste sensitive student data; treat AI as a **draft generator**, not an oracle.”
 - Point them to the **companion website resources**:
 - quick-start guide,
 - teaching strategies,
 - prompt frameworks.
 - Close with your **balanced approach** message.
-

What About Agents and Advanced Concepts?

Guidance:

- Keep **agents** firmly **optional**.
- Mention once, near the end:

“Once you have prompts that work reliably, many tools let you turn them into reusable ‘assistants’ or ‘agents’. I’ve built a few demos – e.g., a course-schedule assistant – and I’m happy to show you one if we have time or afterwards.”
- Only demo if:
 - The group moves quickly and is clearly hungry for “what’s next”, or
 - Someone explicitly asks, “Can we save these prompts somewhere?”

This way, advanced participants feel seen, but **beginners are not overwhelmed**.

Handling “Horse Before the Cart” Concerns

If many participants **aren’t yet using AI**:

- Reframe the workshop as **future-ready design practice**, not tool training:
“Today is about how you, as pedagogical designers and teachers, would *want* AI to work with you – so when tools are available, you’re ready to use them critically and ethically.”
 - Worst case, run everything as **paper prompts**:
 - People draft prompts and critique *hypothetical* outputs you bring on slides.
 - This still builds conceptual and critical capacity, even without live access.
-

Copilot Download Limitation – Adapt the Demo

Given you **can’t download files** in your enterprise Copilot setup:

- Drop the “spreadsheet → plots → PPT” chain from the live demo.
- Replace it with something entirely **in-tool**, for example:
 - Paste a small, anonymised table into Copilot; have it summarise or suggest insights in text.
 - Ask it to draft rubric descriptors or rewrite an assignment brief.

Emphasise:

“In practice, you may still copy/paste outputs into PowerPoint or Word manually. The conceptual lesson – **prompting and critique** – remains valid even if the last step is manual.”
